Yagi Studio/Taxi/Getty Images The female part of the plant is a pestel and the male part of the plant is stamena. Pistil includes ovary, style and stigma. Stamen consists of anther and a thread. Pollen consists of male reproductive cells. Flowers are the reproductive structures of flowering plants. Pistil is a bowling-contact shape and found in the center of the flower. The stigma gets pollen, the style of connective tissue between the stigma and the ovaries. Dust produces pollen and strands of stems that support dust. The petals contain perfumes and nectar glands, and they are usually colorful structures that make up the flower. The chalice is a leaf structure that provides the body for flower buds. The number of bowls and petals is used to identify plants. Dicot plants have chalice and petals in multiples of four or five. Monocots have chalice and petals in multiples of three. There are many different ways a flower plant is located on the stem. A single is used to describe one flower per stem. Cyme is used to describe a flat or convex flower with an inner flower hole first. Corymb is used to describe stems arranged along the main stem, and outer inflorescences have more pedicures than internal flower colors. Catkin is used to describe a thorn only with pistillate or staminate flowers. Raceme is used to describe a spike modification with colors attached to the main stem stem. Spike is used to describe colors attached to the main stem without stems. Aside from the fact that there are some obvious physical differences, male and female dogs are not all that different. But, the biological sex of a dog can sometimes explain some specific health and behavior issues, especially if an animal is un-neutered or un-spayed. INSIDER has spoken to veterinarians and dog behavior experts to find out how a dog's biological sex can play a role in animal behavior and overall health. In some cases, un-castrated male dogs are more likely to try to mark their territory or hump other un-neutered or intact male dogs, usually more prone to urine markings and humping, Ashley Valm, manager of the behavior shelter at the Humane Rescue Alliance, told INSIDER. This urine labeling is a natural but sometimes undesirable behavior often used by dogs who try to mark the space as their own. Humping is a natural and fairly normal behavior for male and female dogs, although it is often the most common in un-castrated male dogs. Dogs hump for many reasons that are not sexual, including stress, excitement, or exercise control over other dogs. Un-neutered male dogs may also be more prone to roaming than female dogsValm also added that un-neutered male dogs can also be more prone to roaming - running away or wandering out of in an attempt to find the mate. However, the likelihood of such behavior can be reduced by castration of your male dog. Female dogs are often said to be easier at home train than male dog dogs be more attentive to your owners. Getty Many pet owners report that female dogs are easier to house train and more attentive to their owners than male dogs, with male dogs being more out of the way. Johanna Reel, a registered veterinary technician for NHV Natural Pet, told INSIDER. And while this idea is widespread, it is important to note that it has not been extensively researched and the dog's temperament and attentiveness may depend on a wide range of factors such as its breed and environment. Un-spayed female dogs go in the heat about two times per year and male dogs are not un-spayed, a mature female dog typically passes estrus or goes in the heat about two times a year, although this varies from dog to dog and can be affected by the size and breed of the animal. During this time it usually secretes vaginal discharge, which varies in nature from very bloody and thick light and watery. This secretion signals to male dogs that it is fertile. This can last from two to six weeks per cycle. On the other hand, the majority of un-neutered male dogs are able to reproduce round-up so they don't experience this. Male and female dogs sometimes have different, biological-sex-specific health problems In un-castrated pets vary between the sexes. Female dogs can develop breast tumors or an infected uterus, while testicular cancer and prostate problems occur in men, Jessica May, lead veterinarian at FirstVet, told INSIDER. It is noteworthy that neutering and spaying your dog can reduce many of these risks. May also added that the timing of both male castration and female spaying can also affect the risk of developing certain diseases and health problems in the dog. According to the American Association of Animal Hospitals, spaying a woman's dog before her first heat cycle significantly reduces the risk of her developing breast tumors. In addition, castration of a male dog can reduce the risk of prostate cancer in an animal and virtually eliminate the risk of testicular cancer. But overall, the way you train and lift your dog tends to have the greatest impact on who they are - not their biological sex nurturing a dog is crucial, regardless of their gender. iStock Despite some established behavioral and physiological differences between male and female dogs, biological sex does not play a huge role in the personality of the animal as a whole. There is very little scientific research into whether a male or female dog makes the best pet. The main differences seen between the behaviors that dogs display tend to be down to learning, the environment and parenting. May told INSIDER. After all, every dog is unique. Read more: Google uses information about you, including your gender, to tailor ads to your personality and interests. You see this information on your Google account's ad settings page. Here's how to see whether Google got your gender right and how to change it if it's wrong. Cookies are a piece of information stored in a web browser. web browser. usually indicate your interests, previously visited sites, and displayed demographic information, such as your gender. This information is gleaned from the sites you visit and your interactions with the pages. You may also have entered this information into your Google profile. Google uses this information to personalize the ads you see. For example, after visiting several websites about shoes, you may notice that advertisements on other sites display shoes. You should not passively accept this information. You can see and correct your Google account information, including gender. You can also set up and disable ads for a while. Here's how it's done. Choose a profile icon in the top right corner on the google.com. Select Google Account Management. Choose personal information from the left menu. Next to Gender, make sure the record is correct. If not, select Paul and then select the appropriate record. Choose data and personalization, and then look at personalizing ads to find information collected by Google about you. The first categories contain personal information such as gender and age. Other categories cover areas of interest. Choose any category to describe where Google collected the information. If you don't want Google to use this information, select Off in each category. When you do, Google won't take that interest into account when targeting you with ads. To change the kinds of ads Google shows you, go to ad settings and turn off any topics you don't want to use to target ads for you. This may take some time. It is not uncommon to have hundreds of categories of interest that have been identified through the browsing history. To completely disable Google's ad personalization, move the slider on the ad personalization screen to off position. You'll still see ads, but you won't be closely targeted. Ads may be affected by the time of day, the overall location, or the topic of the web page you are viewing. Here's what Google has to say about turning off personalization ads: You'll still see ads, but ads will be less useful to you. You will no longer be able to disable ads from specific advertisers. Any advertisers or interests you have turned off will not be saved. The opinions expressed by the participants of the entrepreneurs are their own. As an engineer, I was fortunate enough to work to make 5G - the fifth generation of wireless network technology - a reality. 5G will propose a sea speed change, reduce the delay to less than 10 milliseconds - many times faster than the blink of an eye - and allow connectivity in the billions of devices we use today. Related: Women's Tech Officer: Where Are We Going From Here? This giant step forward can have a significant impact on how people live, learn, work and play. From cars and smart communities before immersive education: 5G will accelerate these and many other achievements. I was part of the team that last year launched the world's first 5G commercial service, Verizon 5G Home Broadband Service. And through this process, one thing has become clear about the engineers around me, even when they -- we -- have been working at the forefront of devastating change: there is no such thing as a perfect engineer, man or woman. With what's said, I can add three extremely important takeaways for technology companies and entrepreneurs who want to be cutting-edge change makers. Companies and entrepreneurs who want to be perfect innovators. Here are these three things to move your company forward: Break stereotypes now. You don't have to be a nerd to be a technical visionary. However, when people think of engineers and scientists today, they often imagine Sheldon from The Big Bang Theory or Richard Hendricks of Silicon Valley. They take a picture of someone locked up in the lab. And this man is usually white and masculine, with certain stereotypical traits. Unfortunately, such continuing stereotypes continue to shape the career path of many girls. While tech jobs are among the fastest growing in the country, girls are left behind. Less than one in five computer science graduates are women. Fortunately, despite the growth of STEM education in schools, organizations such as Girls Who Code are introducing young girls to technology and challenging them to use their skills to solve real-world problems. My friend and I founded a local branch to help girls learn about strong role models in the technical space and to understand that success in technology has nothing to do with pocket protectors and glasses - or gender. In this context, it is important that hiring managers review the standard requisition of work. Not every role in technology requires technical knowledge. Engineering education is not a prerequisite for engineering. Rather, engineering needs to address problems and risks. It is these soft skills that more companies need to start learning to determine how to expand their staffing pool. Related: Why gender diversity in technical issuesInvite different points of view. Studies have shown that different perspectives lead to improved products and faster rates of innovation. According to a McKinsey study of 366 state-owned companies, those in the top quartile for racial and ethnic diversity were 35 percent more likely to have a financial return above their respective national median industries. Similarly, Boston Consulting Group found that the most diverse businesses it has studied are also the most innovative. Ultimately, by welcoming people with different perspectives and experiences to the table, companies can improve problem solving and better understand the needs of their customers. Bringing 5G to market last year involved a diverse team of engineers, but also a range of people with different competencies, and with extremely different fields our company is a professional company, ranging from storytelling strategists to market researchers. You also need a diverse set of partners who know the different technologies needed to make 5G a reality. We Are We together technology companies such as Ericsson, Kvalcomm, Intel and Samsung to propel the entire 5G ecosystem forward. Working with these partners on a common vision of why the world needs 5G and how to deliver it has helped accelerate technology. Many in the industry predicted that 5G would not be available until 2021, but we managed to put the technology in the hands of customers in 2018. Don't be afraid of the unknown. Part of my role is to dream big. Today my work focuses on imagining how 5G will shape our world, and studying usage cases. My team needs to imagine how the next generation network will affect sectors as diverse as health, education, games and the media. In other words, every day I imagine a future that has not yet been built. This means imagining how existing technology can be improved by 5G - like putting sports fans in the front seat of a sports game through in-house virtual reality (VR) streaming. Another example? To anticipate destructive technological breakthroughs can only be 5G, such as real-time holographic communication and remote, almost real-time robotics. Related: What is 5G? All you need Know.It it's hard to be a perfect innovator, but bringing together a diverse, fearless team that defies stereotypes is the action a move any company - perhaps your company - can take. By doing so, you will create an environment that encourages new ideas, risk and collaboration. Of course, it will be an environment where there will be no such thing as a perfect engineer.
